# SHIP-TO-SHIP AIS

A new set of eyes for vessel activity

- Ship to shore
- Ship to satellite
- Ship-to-ship

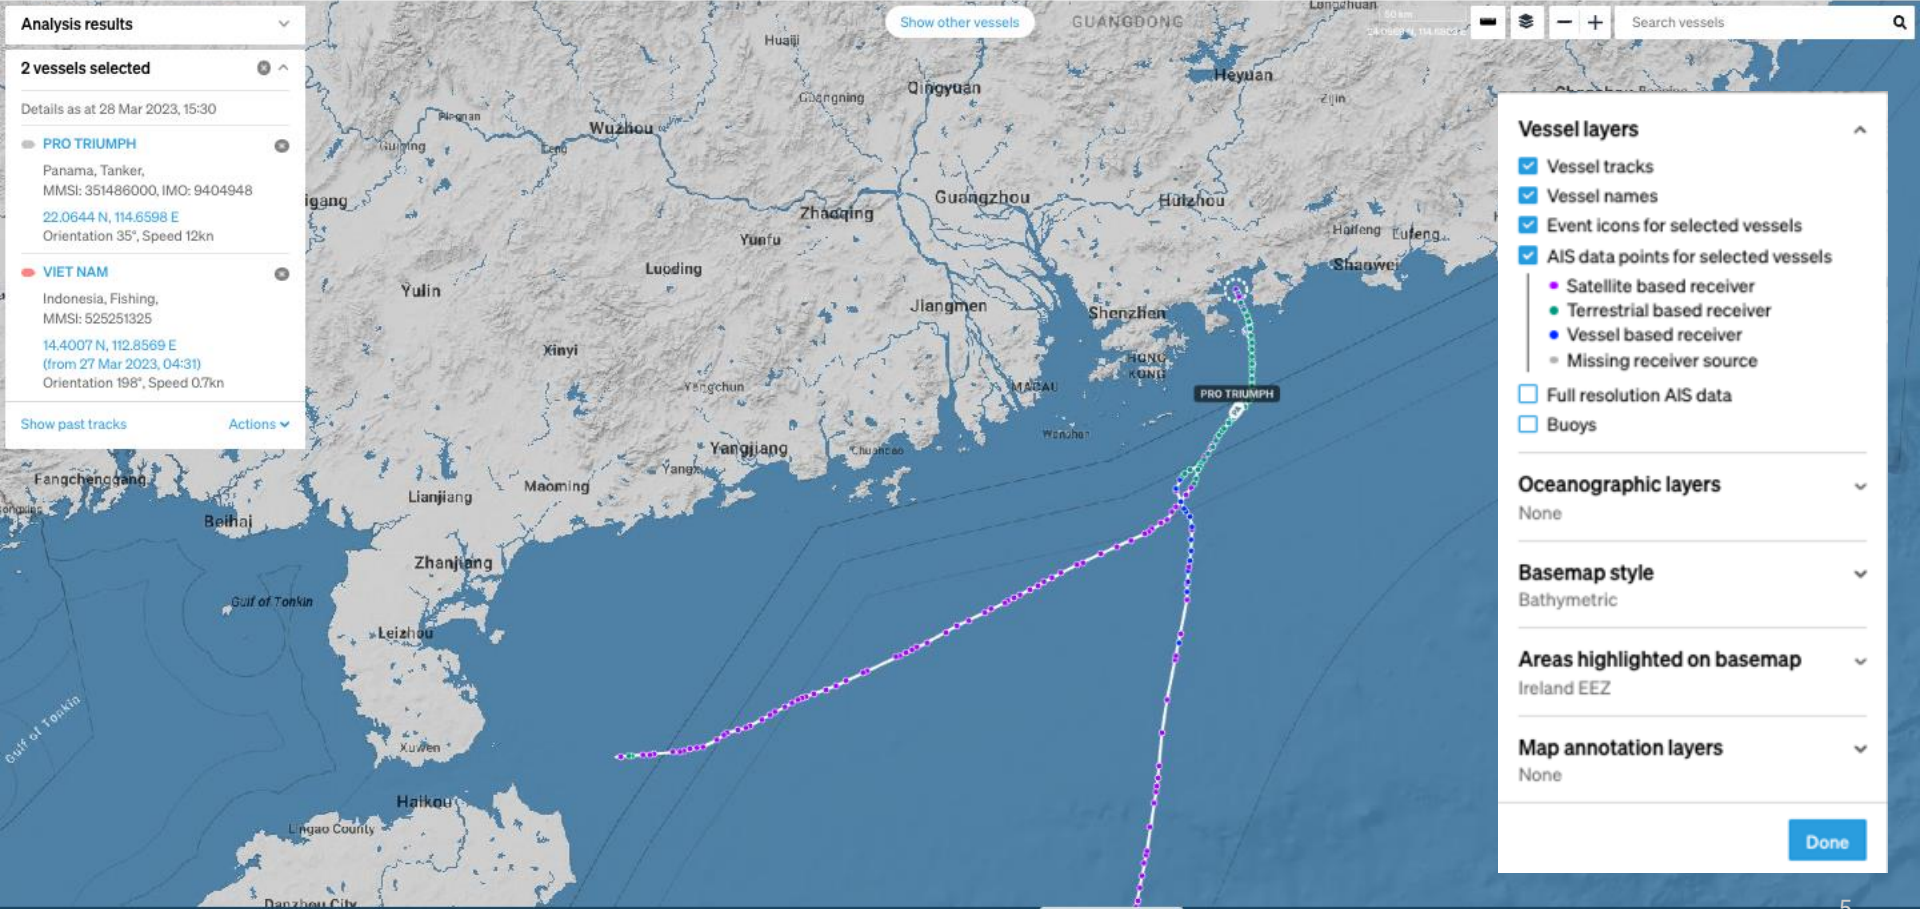

**Analysis results**

**2 vessels selected**

Details as at 28 Mar 2023, 15:30

- PRO TRIUMPH**
  - Panama, Tanker,
  - MMSI: 351486000, IMO: 9404948
  - 22.0644 N, 114.6598 E
  - Orientation 35°, Speed 12kn
- VIET NAM**
  - Indonesia, Fishing,
  - MMSI: 525251325
  - 14.4007 N, 112.8569 E
  - (from 27 Mar 2023, 04:31)
  - Orientation 198°, Speed 0.7kn

# SHIP-TO-SHIP AIS

Ships appear and disappear on passing of a participating vessel.

- Terrestrial
- Satellite
- Ship-to-ship

10875 unique vessels

7476 ship-to-ship only

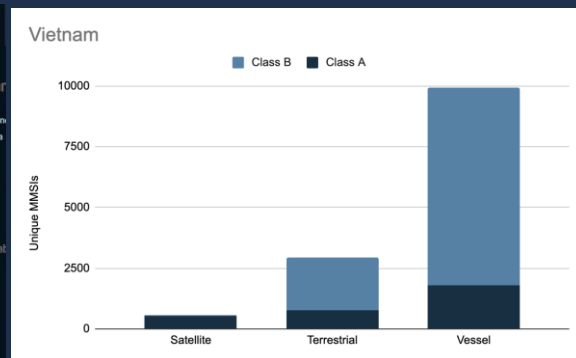

# SHIP-TO-SHIP AIS

Large portion of Class B AIS transceivers

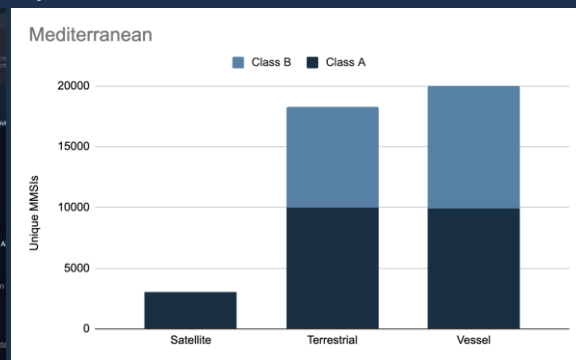

More small vessels observed than by satellite.

Vietnam: 69% of vessels only ship-to-ship

Mediterranean: 23% of vessels only ship-to-ship

# CSIRO

## Voyage Data Recorder

- Low cost (~USD 800)
- Receives data from ship GPS and AIS receiver;
- Compressed data pushed to a secure server via ship's WiFi or 4G;
- Can be installed by the ship's engineer or technician.

## Additional functionality:

- Ingest ship's navigation radar to merge targets with AIS.

AIS targets received by a small yacht over 28 days

Data logger is built from a Raspberry Pi microcomputer and Actisense NDC-5 Multiplexer.

## SHIP-TO-SHIP AIS

Small craft (Class B) transmissions are often not picked up by satellites.

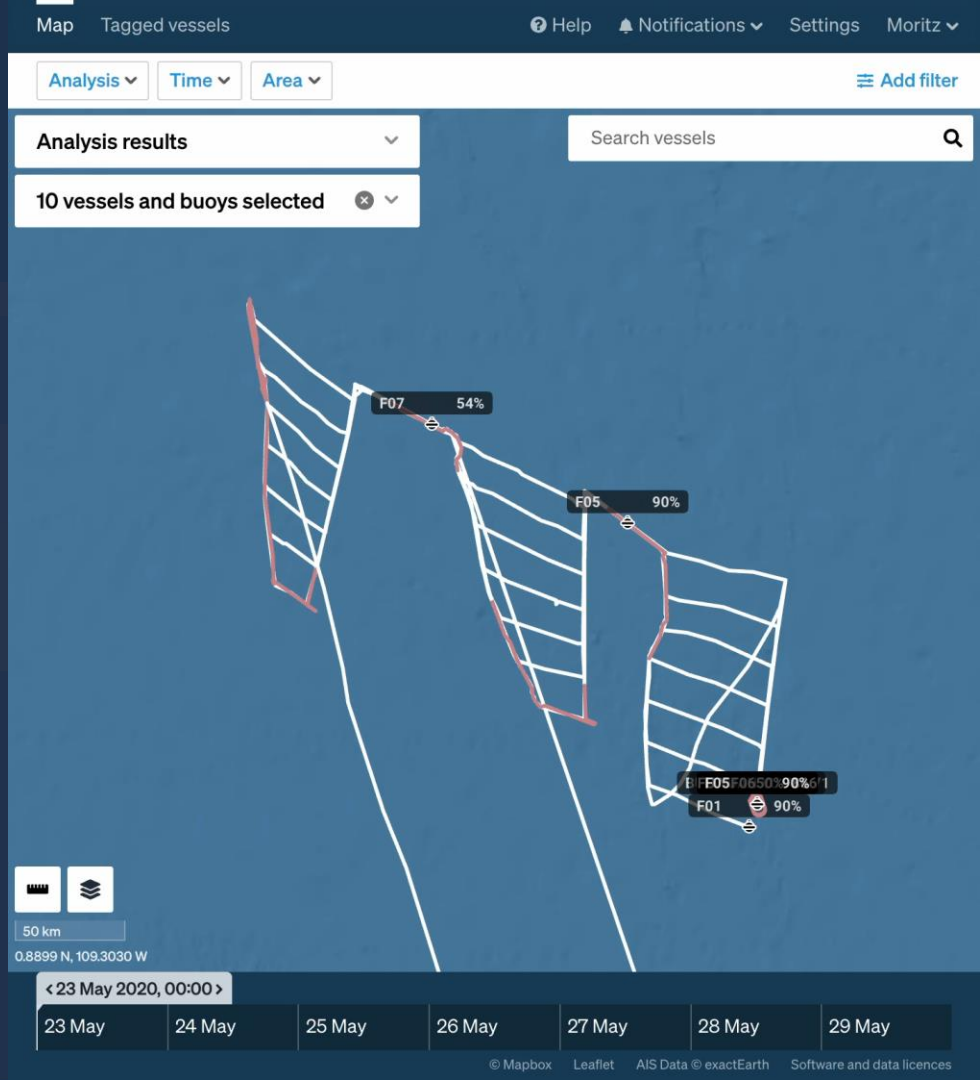

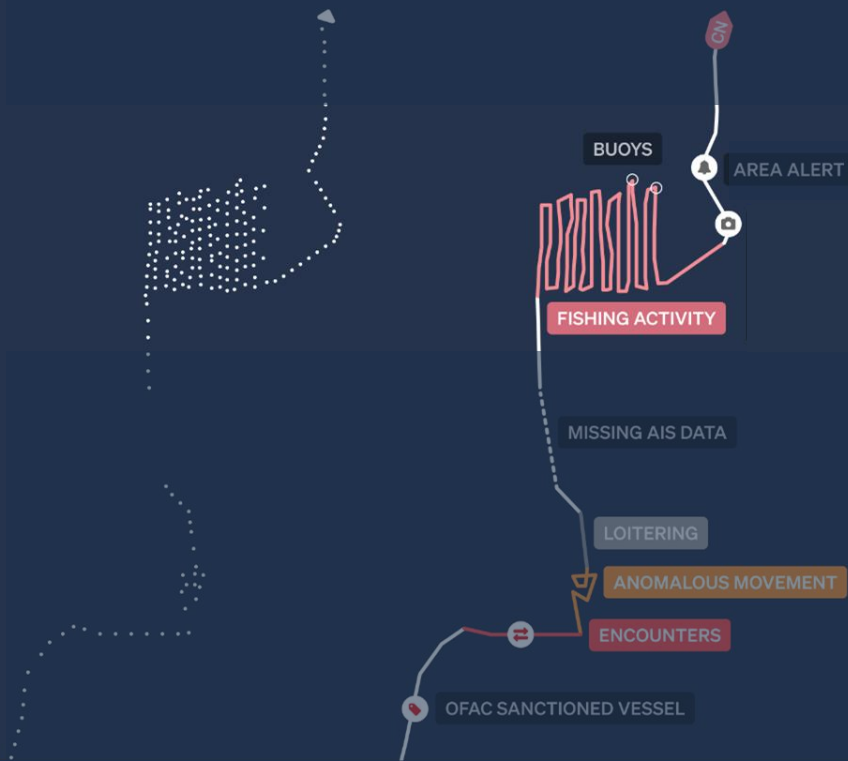

Up to 70% vessels only detected by ship-to-ship AIS in some areas.

CSIRO's system can increase AIS harvest in areas not regularly traversed by global shipping vessels.

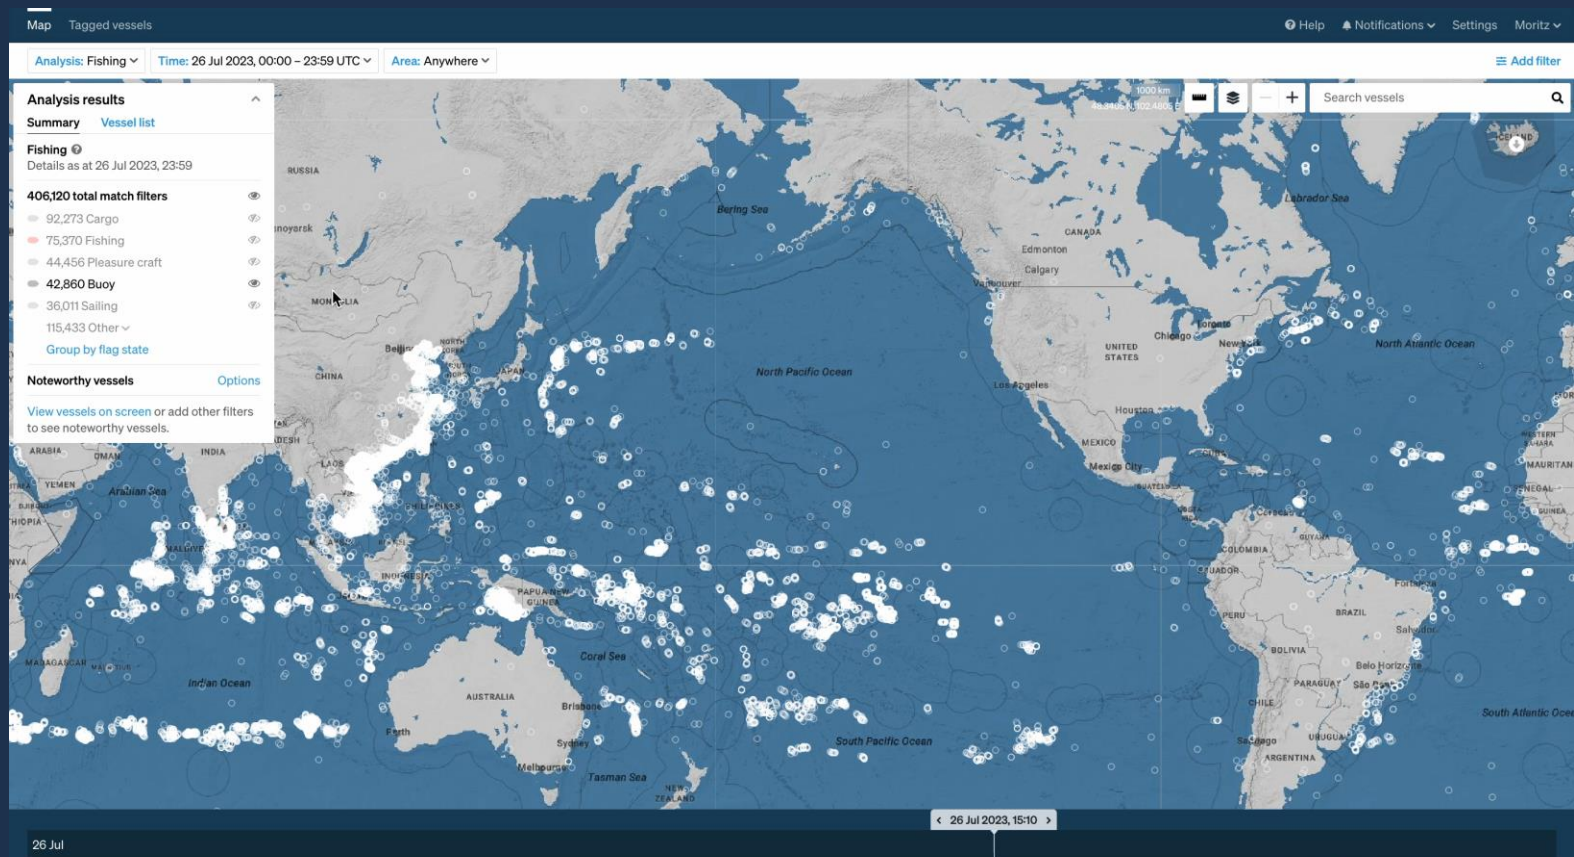

Provides previously unseen activity, allowing updates of estimates of fishing effort and carbon footprint.

Need a way to deal with ephemeral detections: E.g., how to count them for fishing effort and carbon footprint estimation

# AIS transmitting fishing buoys

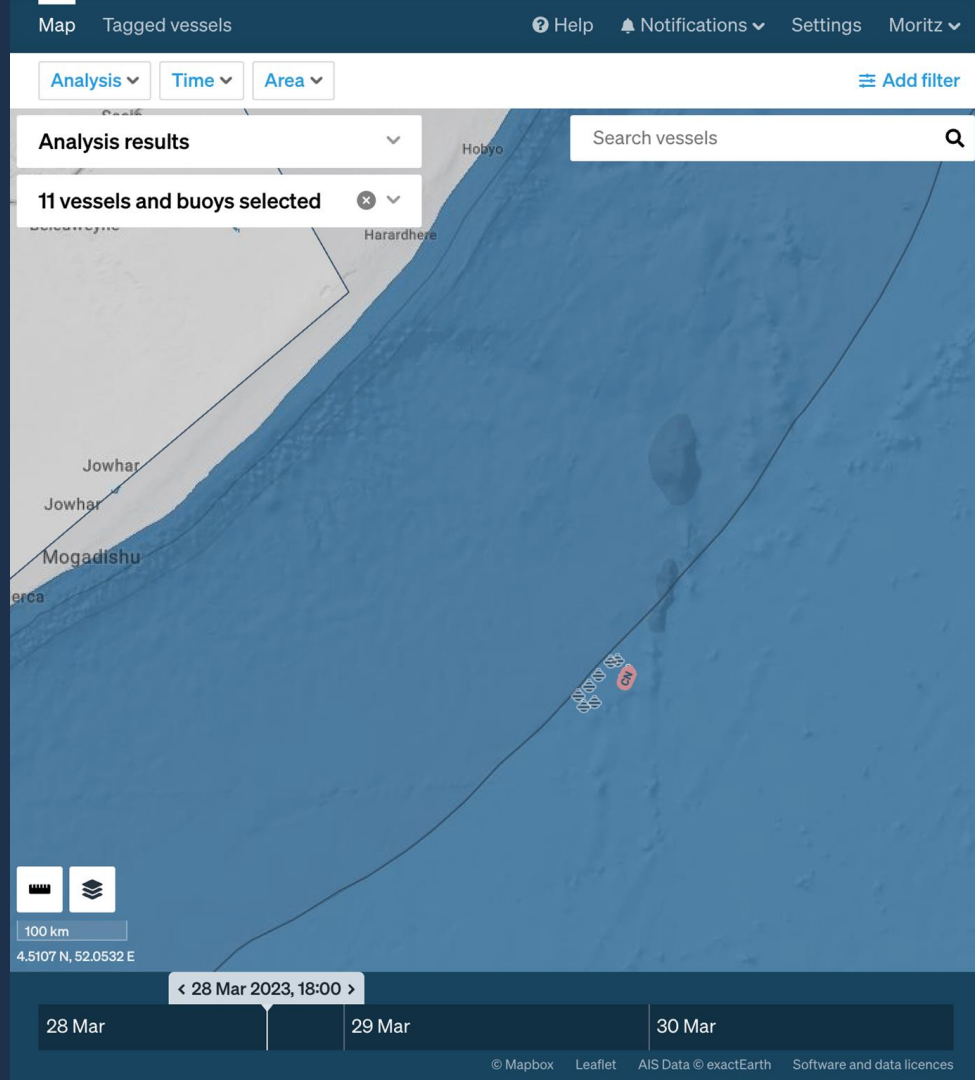

# AIS transmitting fishing buoys

# AIS transmitting fishing buoys

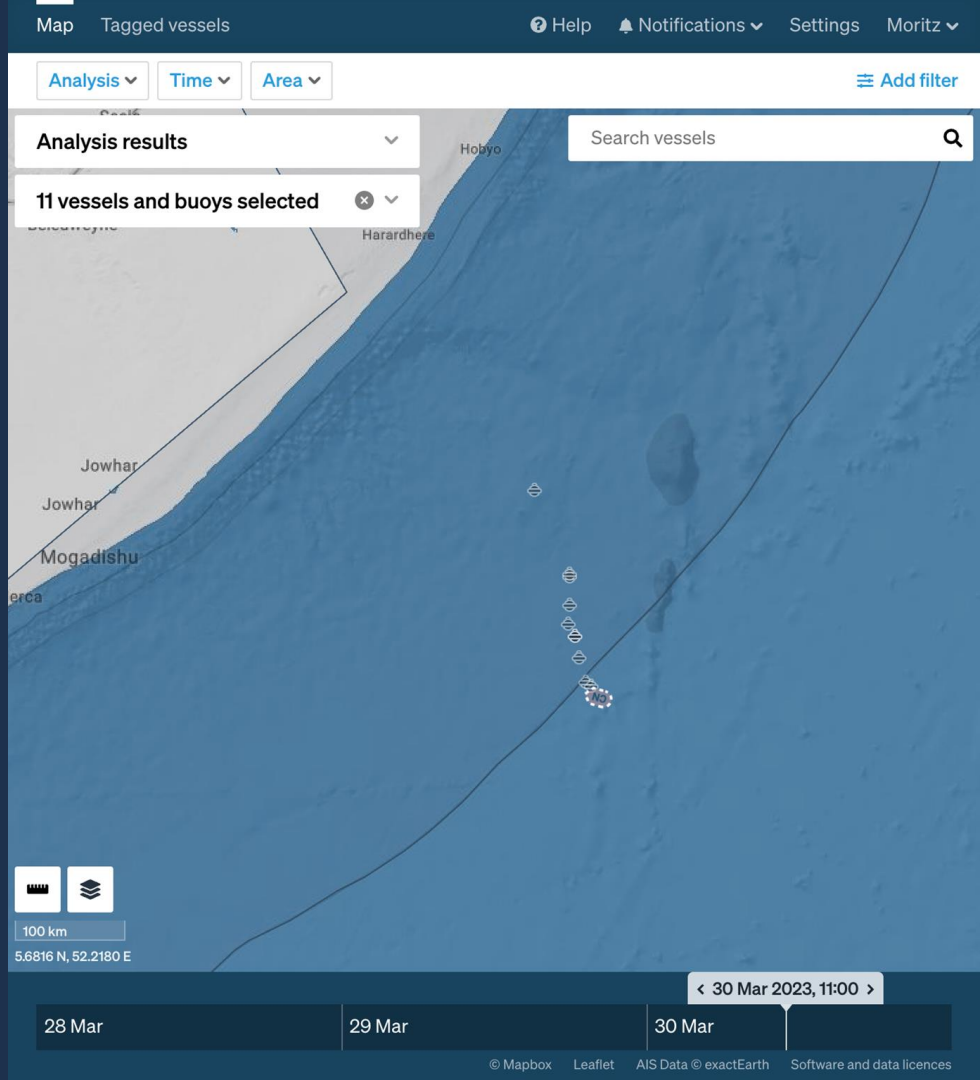

Longlining hugging the Somalia EEZ

# AIS transmitting fishing buoys

Longlining hugging the Somalia EEZ

Vessel stops AIS, but buoys deployed inside EEZ

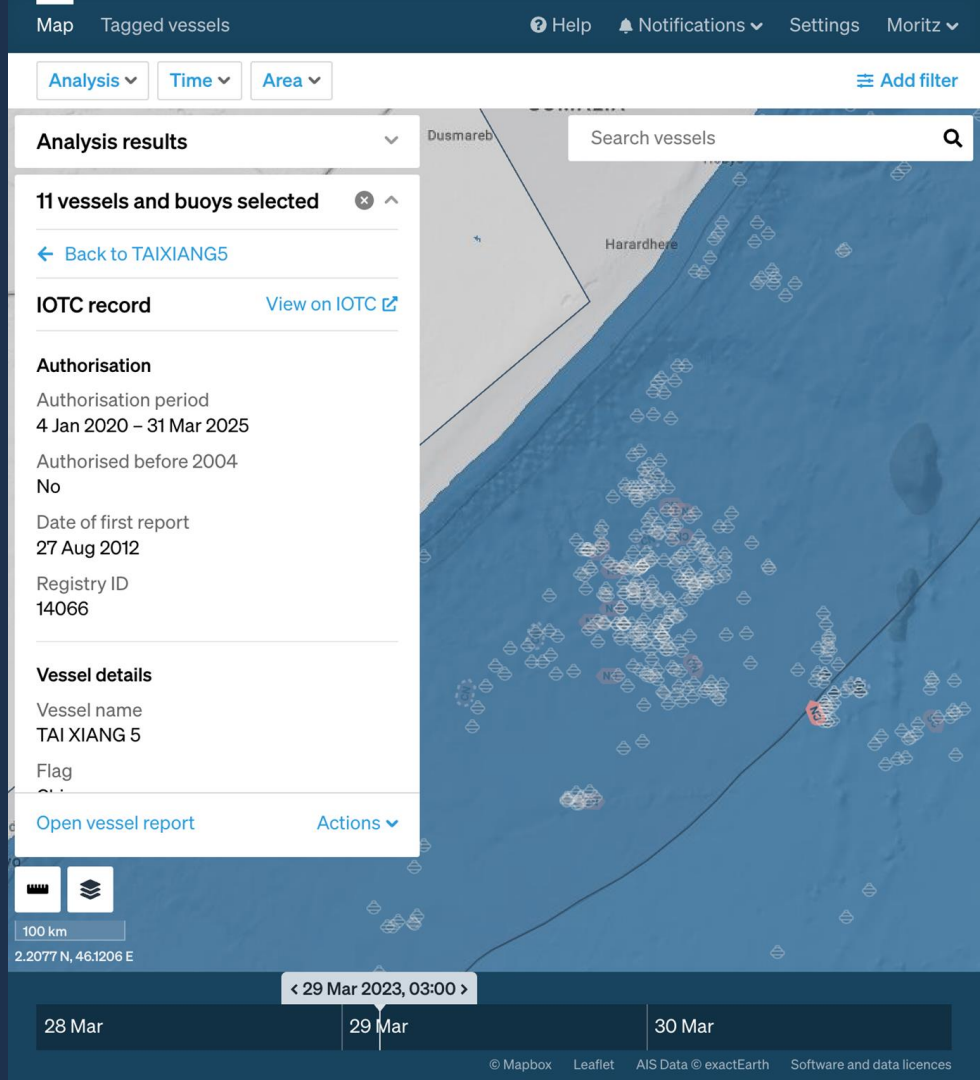

## AIS transmitting fishing buoys

Longlining hugging the Somalia EEZ

Vessel stops AIS, but buoys deployed inside EEZ

AIS outage is suspicious, but no proof for illegal activity.

- Fleet of related ships in EEZ
- IOTC registered

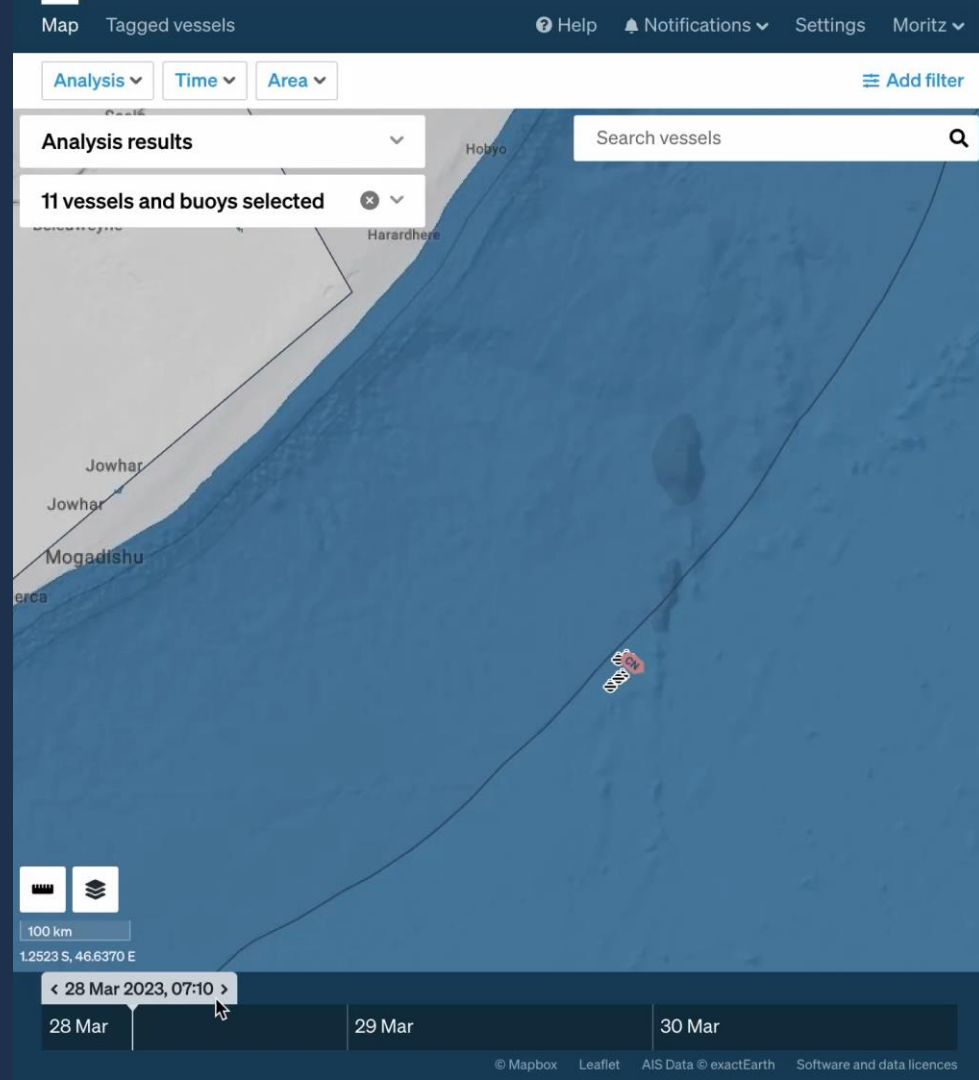

# AIS transmitting fishing buoys

Longlining hugging the Somalia EEZ

Vessel stops AIS, but buoys deployed inside EEZ

AIS outage is suspicious, but no proof for illegal activity.

- Fleet of related ships in EEZ
- IOTC registered

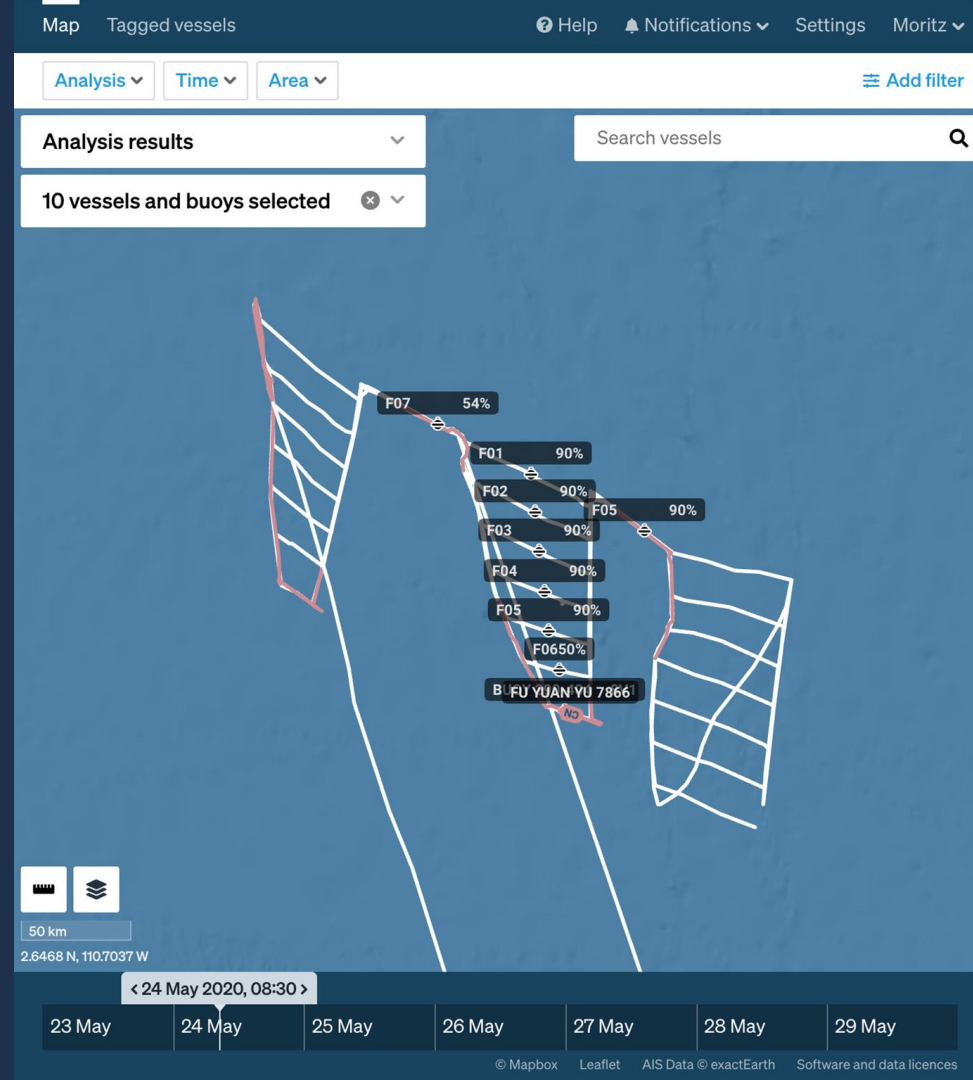

# AIS transmitting fishing buoys

Summary:

Advanced buoy classification algorithm declutters AIS data, streamlines other analytics.

Additional tool for 'dark vessel' detection.

Full resolution AIS data for legal evidence.

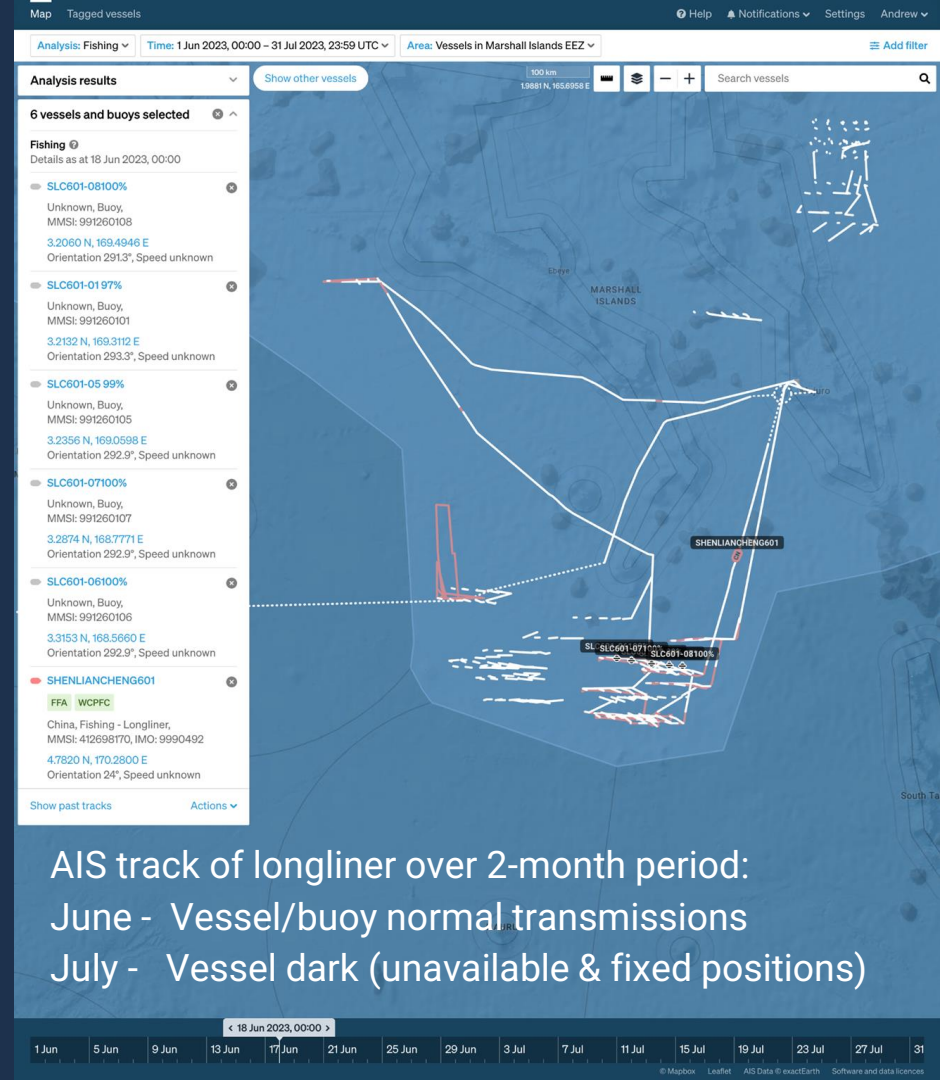

# Tracking non-reporting AIS vessels

Vessels often transmit on AIS without providing valid location data.

Common scenarios:

1. Unavailable GPS - 181/91
2. Fixed positions - null island 0/0
3. Spoofed positions

How can we calculate where the vessel is actually located when the AIS messages don't contain valid positions?

**Starboard  
Maritime  
Intelligence**

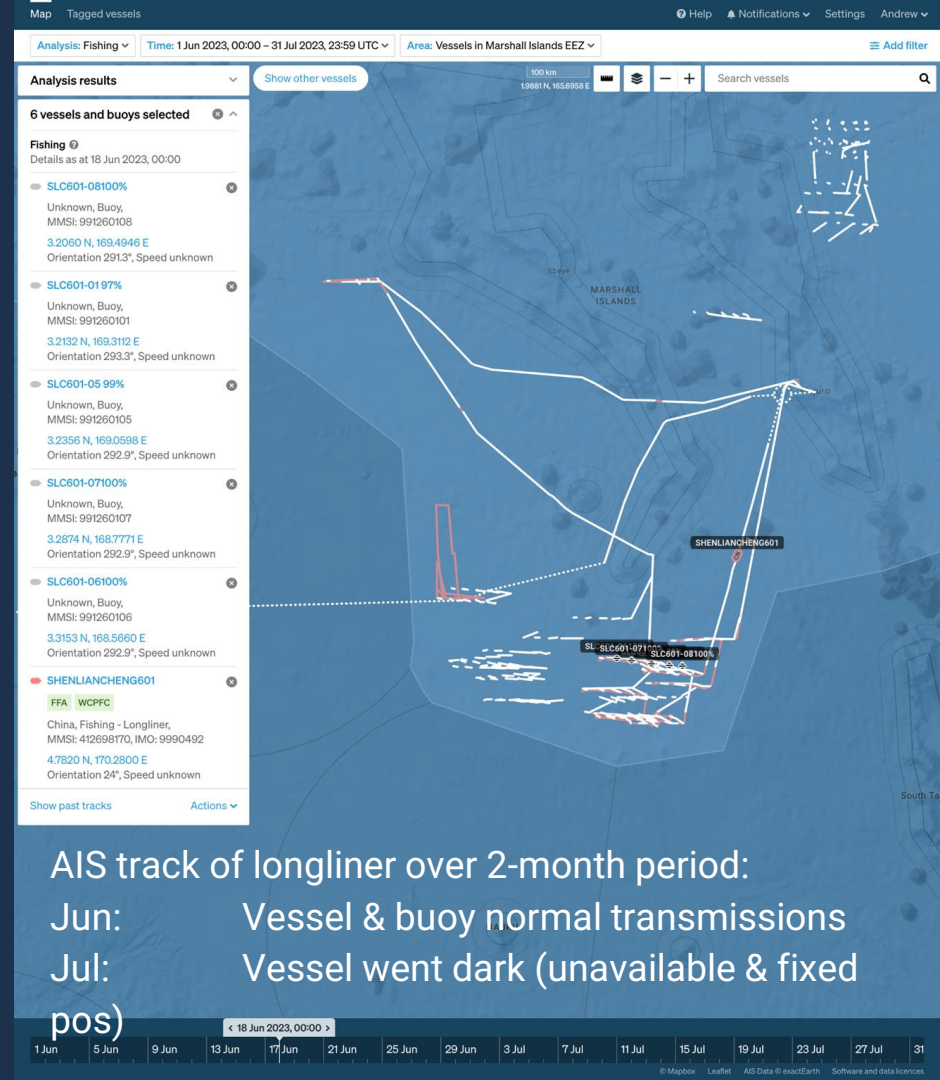

# Tracking non-reporting AIS vessels

Vessels often transmit on AIS without providing valid location data

Common scenarios:

1. *Unavailable* positions (GPS 181/91)
2. *Fixed* positions (null island 0/0)
3. *Spoofed* positions

How can we calculate where the vessel is actually located when the AIS messages don't contain valid positions?

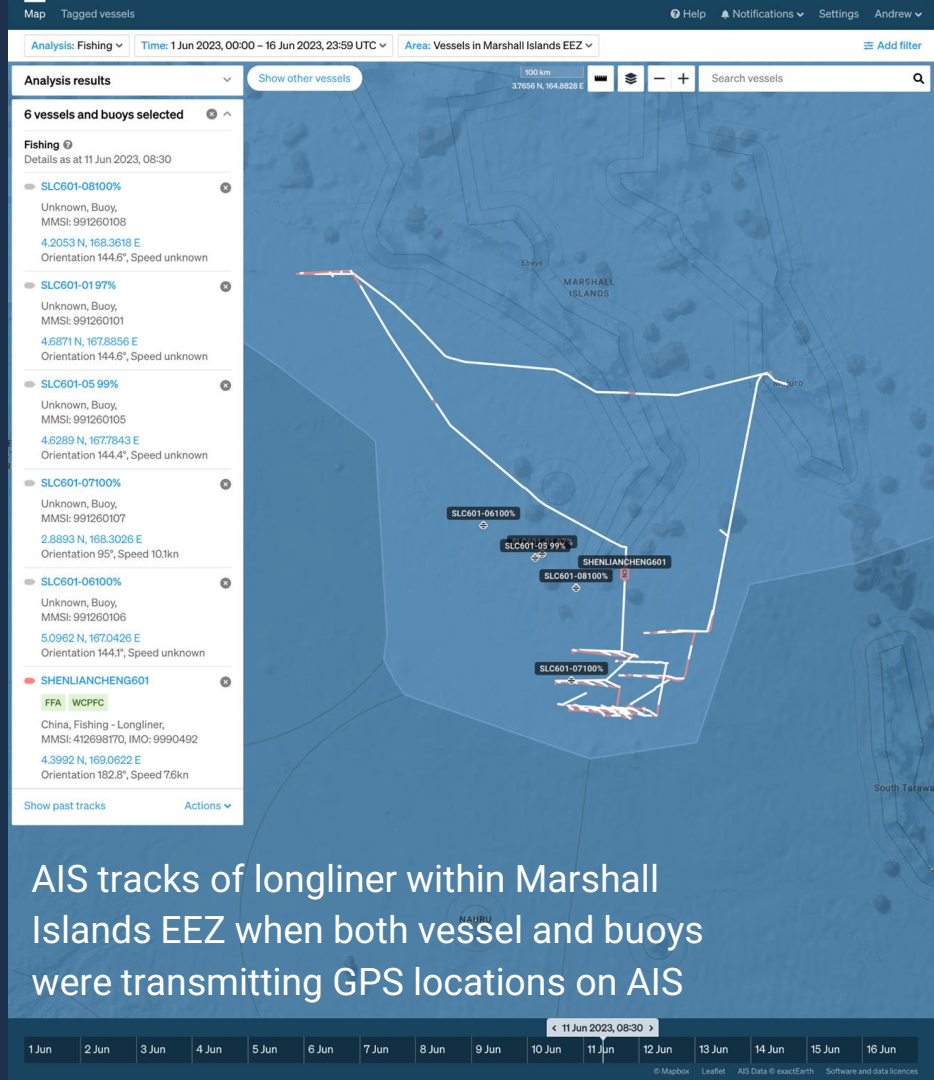

AIS track of longliner over 2-month period:  
Jun: Vessel & buoy normal transmissions  
Jul: Vessel went dark (unavailable & fixed pos)

## Spire Position Validation (PV)

PV geolocates the source of an AIS signal by analysing the doppler shifts measured at the satellite receivers

PV measurement is independent of the contents of the AIS message

In order to work it needs to receive the same AIS message at 5 separate satellites in the Spire constellation

AIS tracks of longliner within Marshall Islands EEZ when both vessel and buoys were transmitting GPS locations on AIS

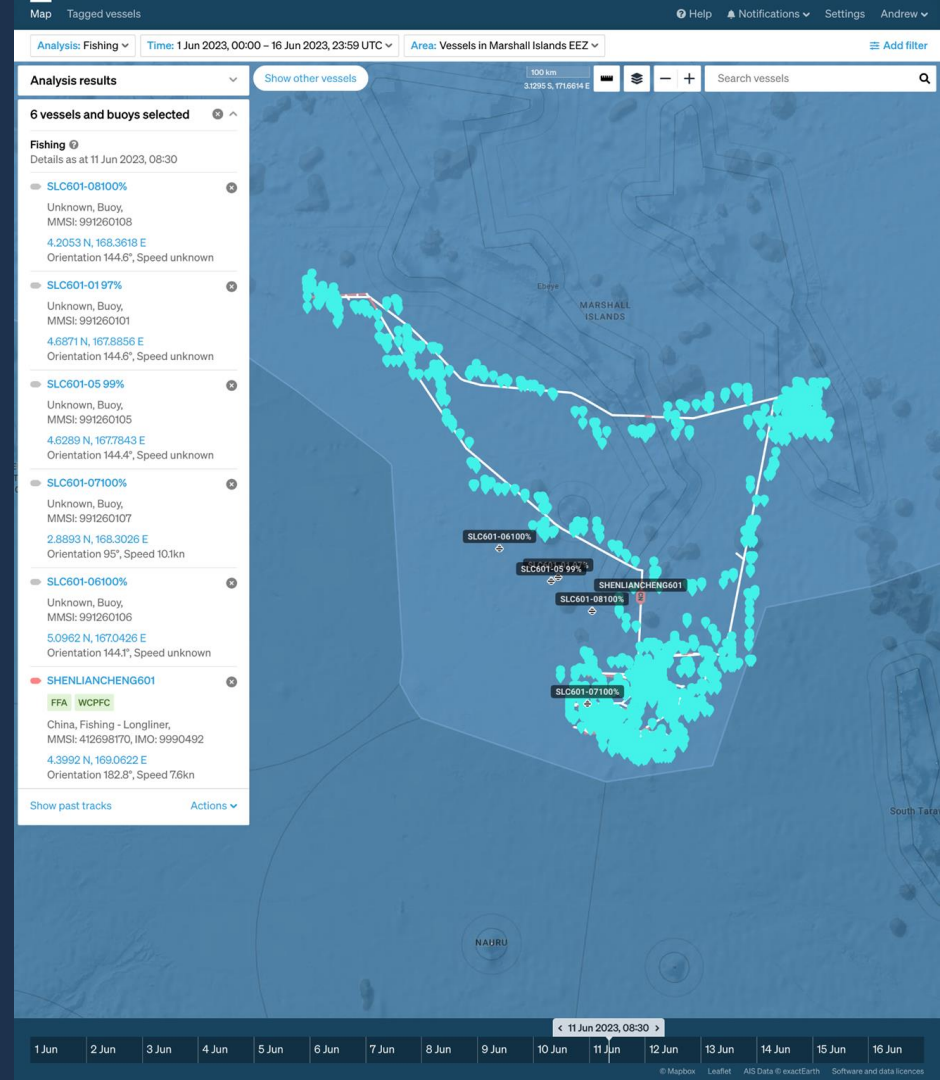

# Spire Position Validation (PV)

## Case 1: Valid AIS transmissions

Spire PV estimates of the signal source match closely with the coordinates provided in the AIS messages

~2,000 PV measurements collected over a 16-day period in June 2023

Results provide confidence in the accuracy of the PV product

# Spire Position Validation (PV)

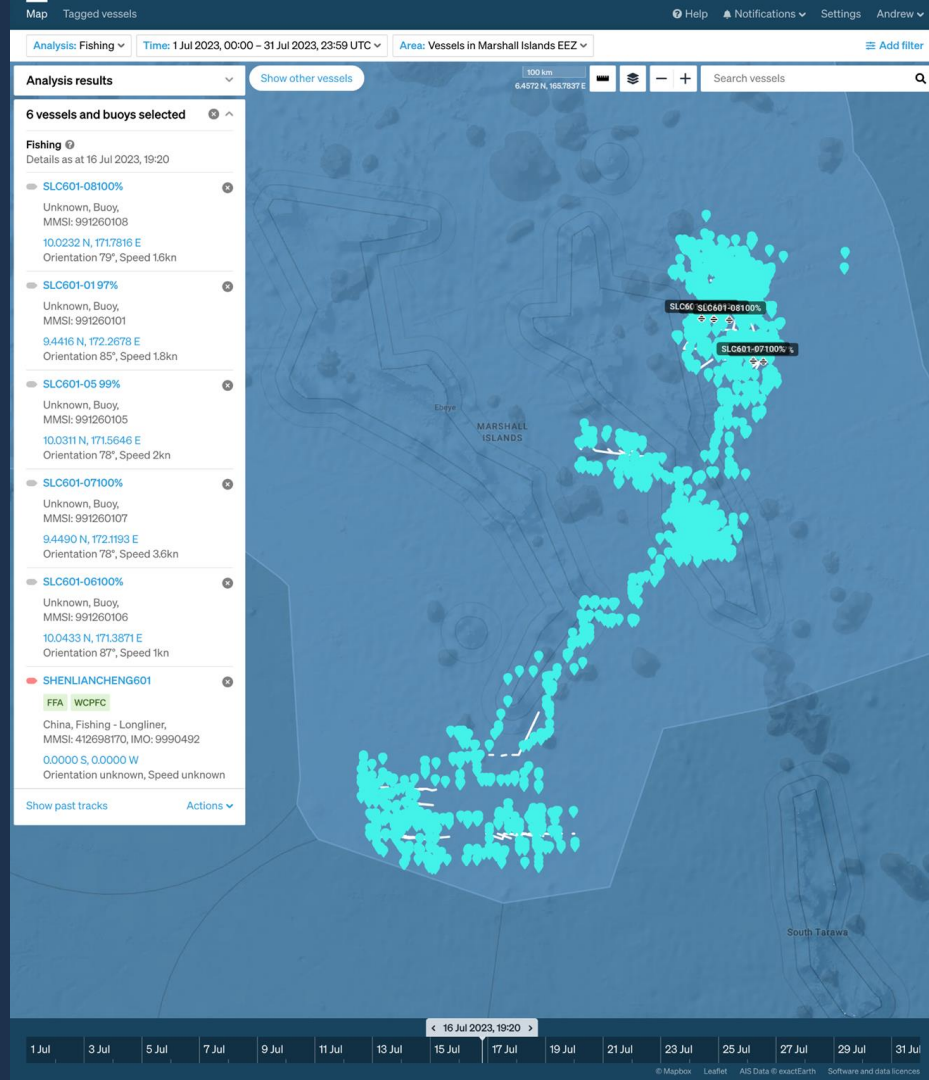

## Case 2: AIS data with incorrect locations

Vessel is dark on AIS, sending unavailable (181/91) or fixed (0/0) coordinates

~2,500 PV measurements collected

PV results correlate with buoys and VMS

Vessel can still be detected and tracked from space despite not transmitting its location on AIS

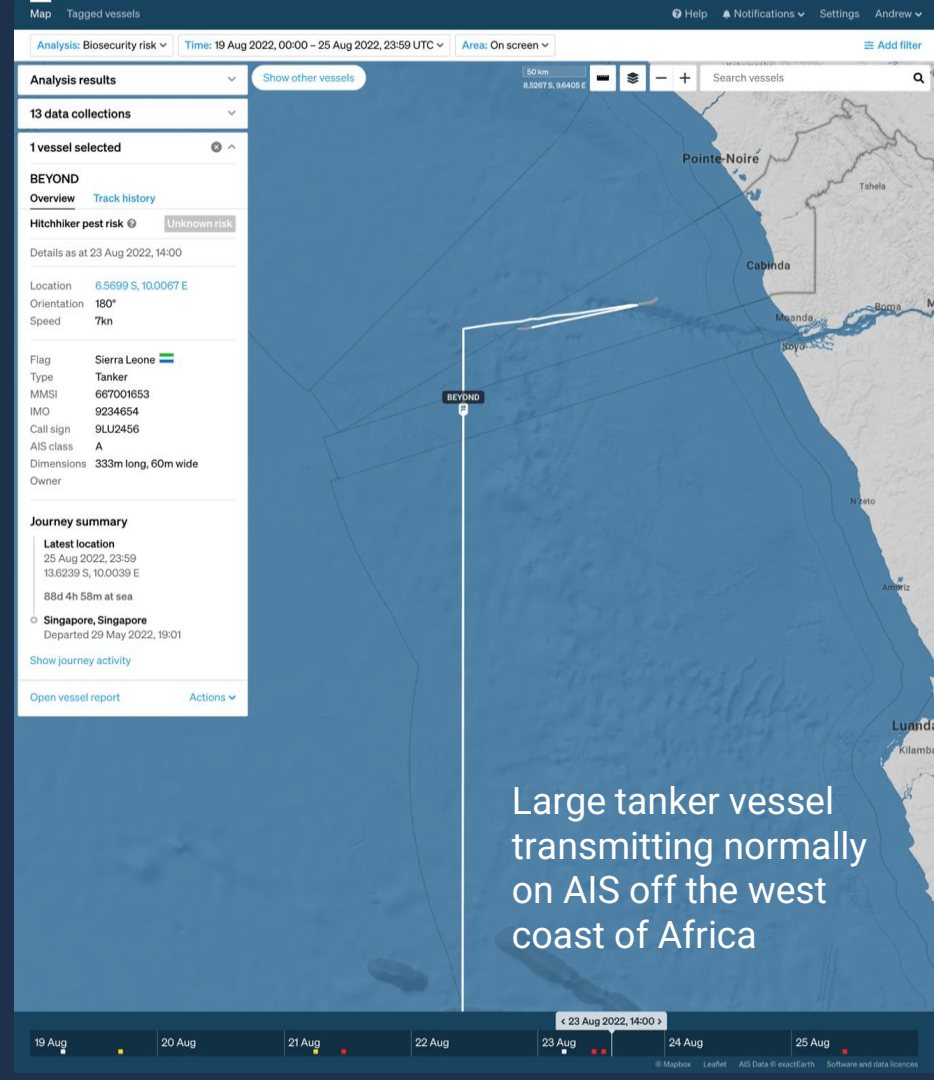

# AIS spoofing

Dark vessel detection is the search for vessels that are not reporting on AIS/VMS

We find dark vessels using SAR, RF & optical satellite sensors

Spoofing vessels intentionally transmit false AIS coordinates to hide their location

For our spoofing approach we use “*inverse dark vessel detection*” to find vessels that are on AIS but are not in satellite data

Large tanker vessel transmitting normally on AIS off the west coast of Africa

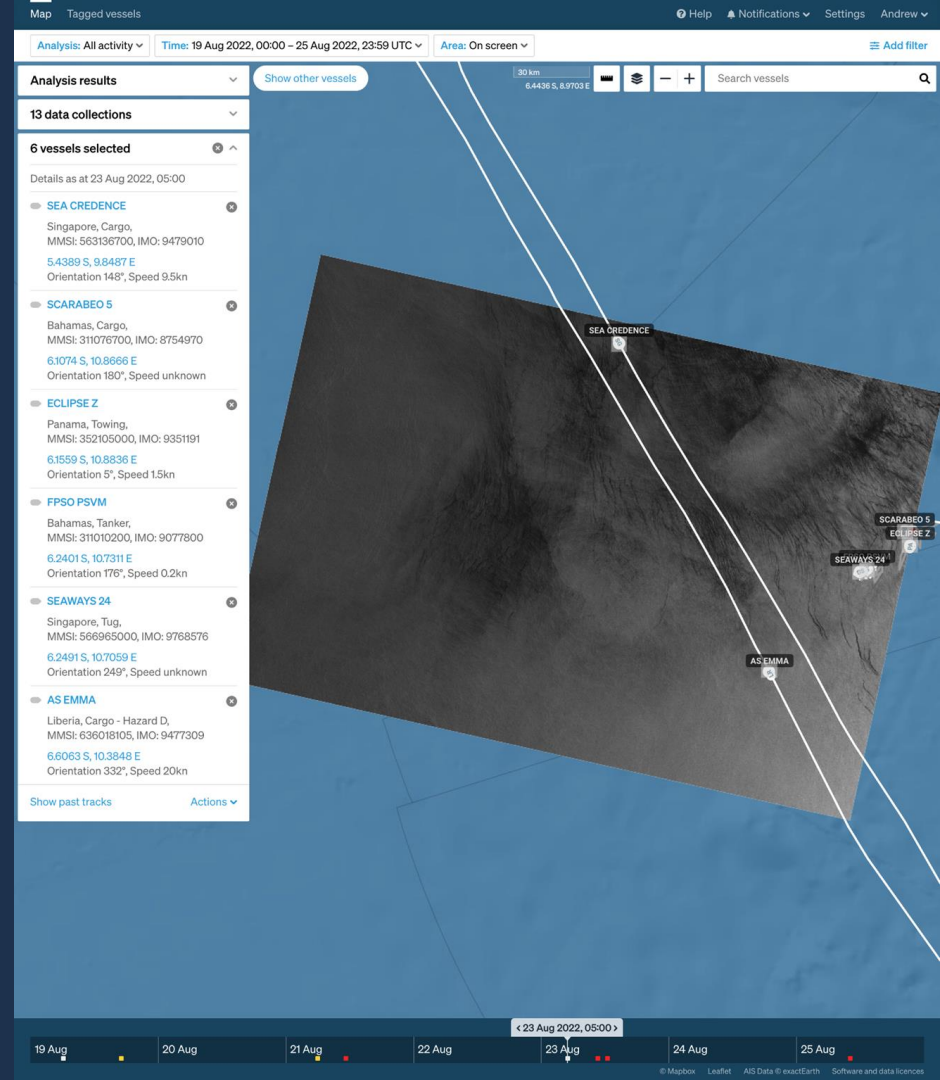

# AIS spoofing

We analysed a SAR image that intersects with the AIS track of the tanker vessel

SAR image contains:

- 6 Total detections
- 6 Matched AIS vessels
- 0 Dark vessels

But the BEYOND tanker vessel is not one of the 6 detections

# AIS spoofing

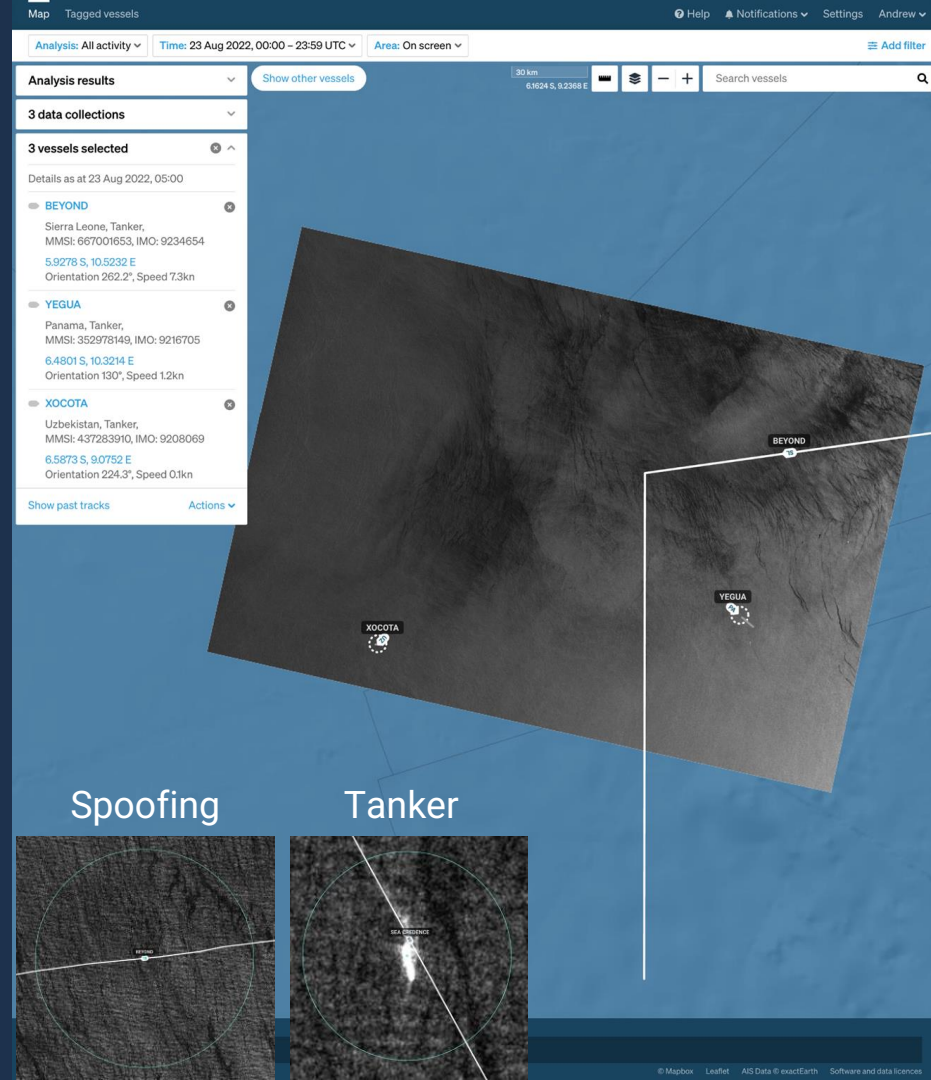

3 vessels transmitting on AIS within the SAR footprint do not appear in the image

All are large >300m tanker vessels that would generate a large radar reflection

Vessels must be spoofing their location

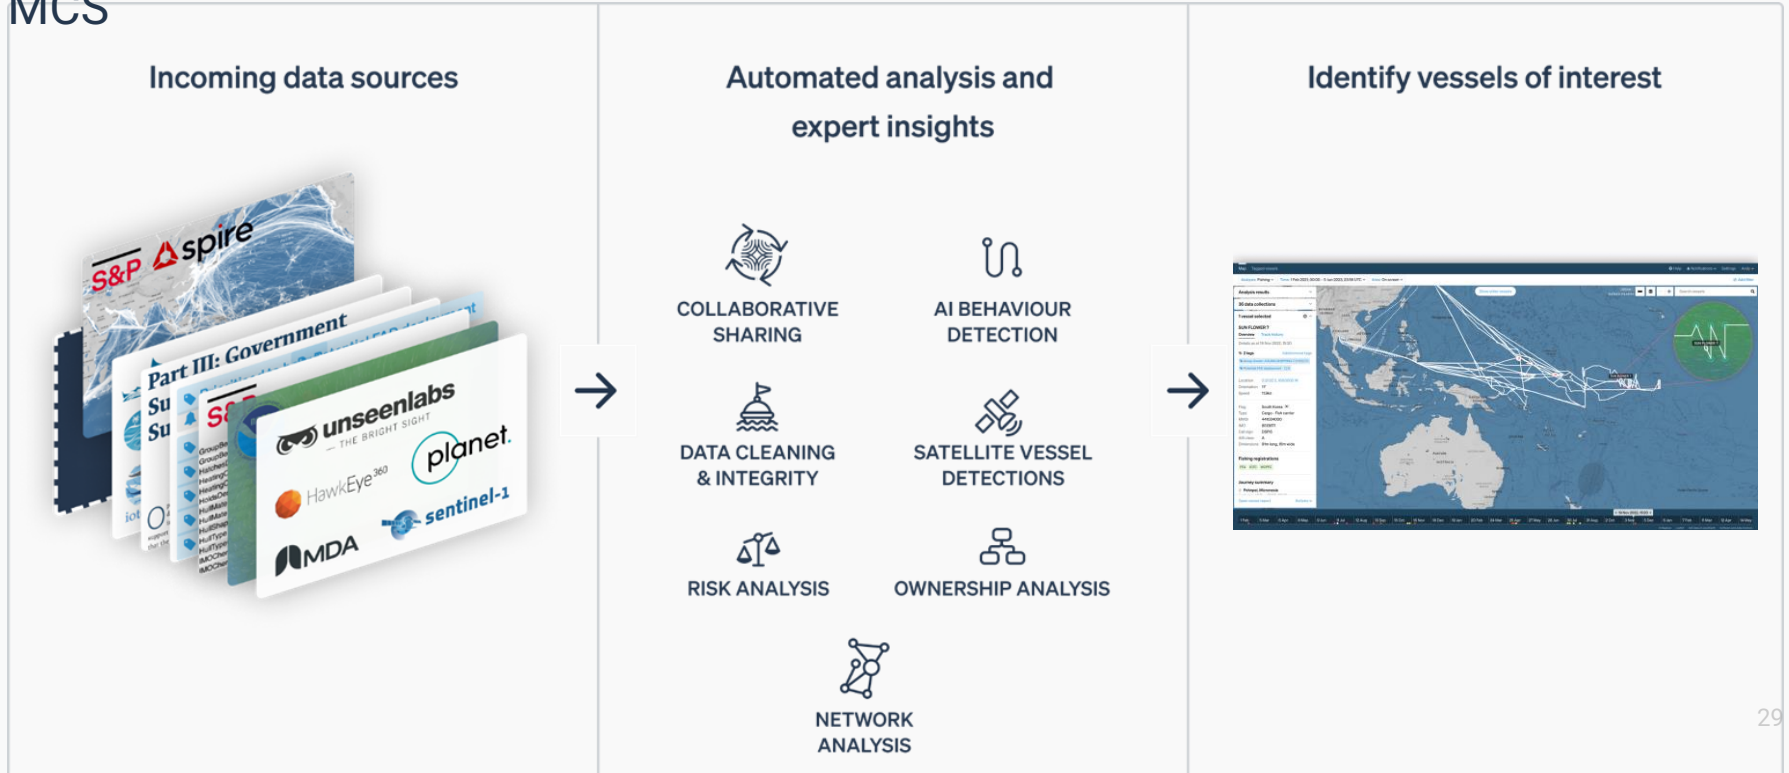

Future plans:

- Extend approach to fishing vessels
- Use Spire PV to find spoofing vessels

# Summary

Advanced AIS data and analytics are a powerful component of comprehensive MCS

See us at the table outside  
for further discussion.
